

The Ficep plate duplicators eliminate the time consuming layout and hole production that is associated with the production of plate and angle detail components. A hydraulic punching head, in conjunction with an optional drilling head, gives the Ficep plate duplicators the capability to process applications that require either punching or drilling.

Ficep Corporation offers a complete line of two-axis CNC controlled plate detail punches for processing both plates and angle material. All systems feature a Windows based CNC control which is provided with the proprietary Ficep software that permits remote troubleshooting with an internet connection.
